Vinícius Freire

Software engineer, Belém, Brazil (UTC−3)
vpaes.freire02@gmail.com | linkedin.com/in/vinícius-freire-86a16841a | github.com/prinny2 | prinny2.github.io

I build software products on my own, from the database schema to the checkout page. In 2026 I shipped LeadBellus and ResonAnza, one for aesthetic clinics and one for oil-field data, learning each market as I went. I'm looking for an early engineering role at a startup, working remotely from Brazil as a contractor or through an EOR.

Experience

Founder and sole engineer, LeadBellus Jun 2026 to present

WhatsApp sales replies for Brazilian aesthetic clinics. Live at leadbellus.com.br at R$97/month, pre-revenue.

- Built the whole product alone: Next.js 16, React 19, TypeScript, Firestore, plus a demo that needs no signup.
- Wrote an LLM fallback chain across OpenAI, Claude and Gemini with timeouts and retries.
- Added checks after generation for guaranteed results, diagnoses, fixed prices and made-up schedules or policies.
- Set up Stripe subscriptions in live mode: checkout, billing portal, idempotent webhooks, and a usage limit enforced in a Firestore transaction.
- Built a Z-API WhatsApp integration (webhook, inbox, auto-reply), now off in favor of copy and paste.
- Maintain 400+ Vitest tests. Run the marketing too: landing page, Instagram content, Meta ads.

Founder and engineer, ResonAnza May 2026 to present

Energy data platform built on public records for 31,244 Brazilian wells. Study stage. Site at resonanza.com.br.

- Built a Python pipeline that reads scanned well reports with Claude, corrects bottom-hole temperatures (Horner) and calibrates per basin.
- Shipped a FastAPI service, Typer CLI and React 19 dashboard, with PDF, GeoJSON and KML exports, on Cloud Run with Postgres.
- Labeled every number as measured or modeled. When real logs showed 24 to 29 °C/km onshore, too low for the original electricity plan, I dropped the plan and moved to direct heat from produced water.
- Maintain 450+ pytest tests, with lint and coverage in CI.

Founder and engineer, LeadSolar Intelligence Mar 2026 to present

Lead qualification for Brazilian solar installers. Core library is open source: github.com/prinny2/lead-intelligence.

- Wrote a rules engine that returns accept, review or reject with traceable reasons, and a FastAPI layer that adds LLM scoring (Gemini, then Claude).

Side project: Iara 2026

Voice assistant for macOS in TypeScript. Runs on Claude, Gemini or local models through Ollama, with approval-gated file and shell tools.

Earlier 2021 to 2022

IT department, CESUPA, Belém (2022). Digital marketing, Pet Home Hotel, Belém (from 2021).

Skills

Languages: TypeScript, Python, JavaScript, SQL
Product: Next.js, React, Node.js, FastAPI, Tailwind
Data: Firestore, PostgreSQL, Supabase, SQLite, pandas, NumPy, SciPy
AI: OpenAI, Claude and Gemini APIs, Ollama, Claude Code, Codex
Infrastructure: Vercel, Google Cloud Run, Firebase, Docker, GitHub Actions, Stripe, Vitest, pytest

Education and languages

Production Engineering, Universidade do Estado do Pará (UEPA). Five semesters, not completed.

Portuguese (native), English (fluent; studied at ASLAN in Belém and Sprott Shaw College in Canada, 2019).
